

Measuring Guide for Blinds

Working out the Width:

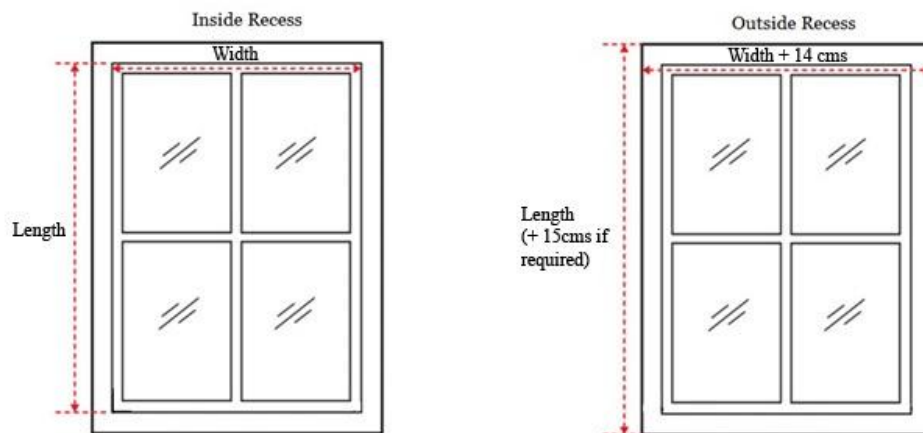

Decide where you want the track of your blinds fitted. It can either sit inside the recess, on the frame itself, or above the window frame.

Recess Width

- For recess blinds measure the inside of the recess in three places: the top, middle, and bottom. You will need to provide the narrowest width. Confirm your measurement as inside recess width, and we will allow for 1 cm to avoid friction when pulling the blind up or down.

Blind Width

- Measure the full width of the window frame if the blind is to be fitted to the window frame or if the blind is hung outside the recess. Add a further 7cms either side to help reduce light filtering through. Please confirm this measurement as outside recess width. Your blind will be made to this exact width.

Measuring the Length:

Measure from the top of where you will place the roman blind track to your finish point, on the window cill or just below the cill, you can add 10cm to this.

If you are unsure on where best to fit your blind, or which type of blind would be best suited to your window please contact us by email together with a photo of the window.
